Data wrangling I

28.04.2022, Data Science (SpSe 2022): T8

Prof. Dr. Claudius Gräbner-Radkowitsch
Europa-University Flensburg, Department of Pluralist Economics

www.claudius-graebner.com | @ClaudiusGraebner | claudius@claudius-graebner.com

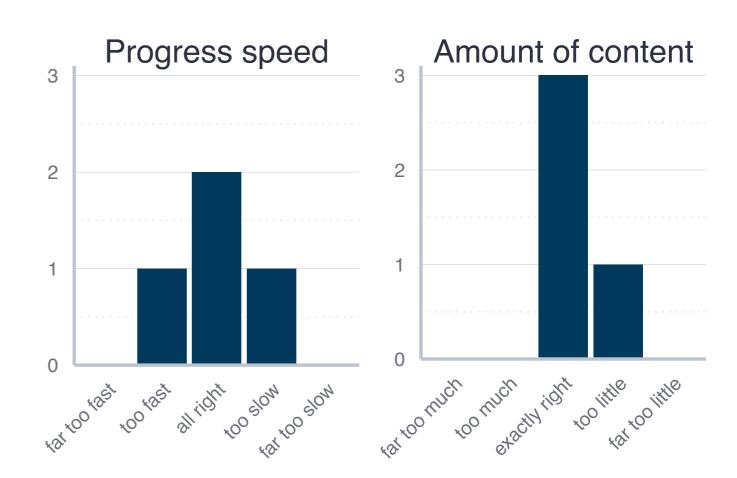

Prologue:

Prologue Feedback and exercises

- Four of you filled out the feedback survey. Main takeaways:
 - You appreciated learning how to share projects
 - There were no particular complaints
 - Several of you liked praised the break and the smileys

Please do not forget to look at the tutorials and do the exercises for this session!

Goals for today

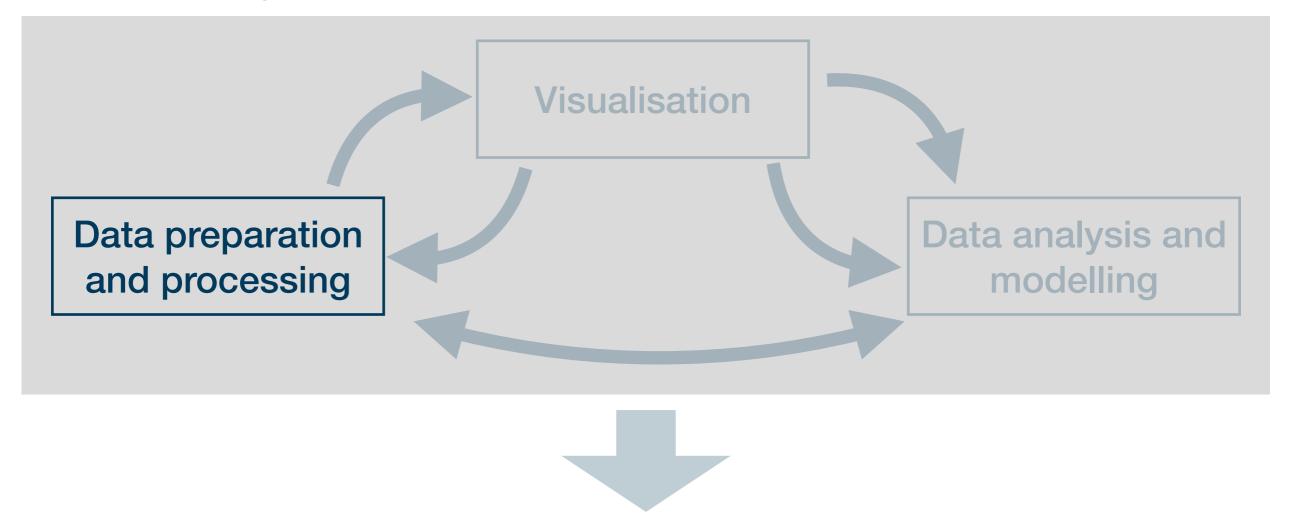

- I. Understand the concept of tidy data
- II. Get an overview over the most common transformation challenges
- III. Master a number of functions from the tidyr and dplyr packages to address some of these challenges

Data wrangling in R

The role of data preparation

- Importing and preparing is the most fundamental task in data science
 - It is also largely under-appreciated

Presentation of the insights: an overall story

What is tidy data?

The goal: tidy data

Tidy datasets are all alike, but every messy dataset is messy in its own way.

Hadley Wickham

- Translation into plain English:
 - We find data sets in all kind of ***-up forms in the world
 - We must turn them into a form that's a good starting point for any further tasks
- Good thing: this form is unique and its called tidy

The goal: tidy data

Every column corresponds to one and only one variable

Every row corresponds to one and only one observation

#	A tibbl	.e: 4 >	< 4	
	c_code	year	exports	unemployment
	<chr></chr>	<int></int>	<dbl></dbl>	<dbl></dbl>
1	AT	2013	53.4	5.34
2	AT	2014	53.4	5.62
3	DE	<u>2</u> 013	45.4	5.23
4	DE	2014	45.6	4.98

Every **cell** corresponds to one and only one **value**

- Every data set that satisfies these three demands is called tidy
- Excellent start for basically any further task but maybe not the best way to represent data to humans

The goal: tidy data

Every row corresponds to one and only one observation

Every column corresponds to one and only one variable

Every **cell** corresponds to one and only one **value**

The goal of data wrangling is to turn such untidy data into tidy data

 After having imported your data into R, you can usually make it tidy using a sequential combination of the following routines:

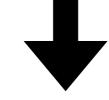

Filter rows according to conditions

 After having imported your data into R, you can usually make it tidy using a sequential combination of the following routines:

Select columns/variables

```
# A tibble: 4 \times 3
  c_code year exports
  <chr> <int>
                 <db1>
1 AT
          2013
                  53.4
2 AT
          2014
                  53.4
3 DE
                  45.4
          2013
4 DE
          2014
                  45.6
```

 After having imported your data into R, you can usually make it tidy using a sequential combination of the following routines:

Mutate or create variables

 After having imported your data into R, you can usually make it tidy using a sequential combination of the following routines:

Reshaping data from long to wide format (and vice versa)

```
# A tibble: 4 \times 4
  c_code year exports unemployment
  <chr> <int>
                 <db1>
                              <db1>
1 AT
          2013
                  53.4
                               5.34
2 AT
                53.4
         2014
                               5.62
                45.4
                               5.23
3 DE
         2013
                 45.6
                               4.98
4 DE
          2014
```

 After having imported your data into R, you can usually make it tidy using a sequential combination of the following routines:

```
# A tibble: 4 \times 4
  c_code year exports unemployment
  <chr> <int> <dbl>
                             <db1>
               53.4
1 AT
         2013
                              5.34
               53.4
2 AT
         2014
                             5.62
3 DE
         2013
               45.4
                             5.23
         2014
               45.6
                             4.98
4 DE
```

Group and **summarise** data

 After having imported your data into R, you can usually make it tidy using a sequential combination of the following routines:

Merge several data sets

# A tibble: 4×4					
	c_code	year	exports	unemployment	
	<chr></chr>	<int></int>	<db1></db1>	<db1></db1>	
1	AT	<u>2</u> 013	53.4	5.34	
2	AT	<u>2</u> 014	53.4	5.62	
3	DE	<u>2</u> 013	45.4	5.23	
4	DE	<u>2</u> 014	45.6	4.98	

 After having imported your data into R, you can usually make it tidy using a sequential combination of the following routines:

Reshaping data from long to wide format (and vice versa)

Filter rows according to conditions

Select columns/variables

Mutate or create variables

Group and **summarise** data

Merge several data sets

- In this, and a later session we will go through these operation
 - Then you are fit to tidy up raw data yourself
- This way you produce the inputs we used for visualisation...
 - …and the inputs we will use for modelling

Addressing wrangling challenges

Session content

We will go through the following challenges via direct demonstration:

Filter rows according to conditions

Mutate or create variables

Reshaping data from long to wide format (and vice versa)

Group and **summarise** data

Select columns/variables

Merge several data sets

- We will use functions from the packages dplyr and tidyr (both part of the tidyverse)
- For documentation purposes check out the lecture notes and the readings
 - The data sets used for the following exercises are all contained in wrangling_exercises_data.zip, which is available on the course homepage

Long and wide data

Rather wide data:

#	# A tibble: 4 × 4						
	c_code	year	exports	unemployment			
	<chr></chr>	<int></int>	<db1></db1>	<db1></db1>			
1	AT	<u>2</u> 013	53.4	5.34			
2	AT	<u>2</u> 014	53.4	5.62			
3	DE	<u>2</u> 013	45.4	5.23			
4	DE	<u>2</u> 014	45.6	4.98			

Rather long data:

```
# A tibble: 8 \times 4
  c_code year variable
                               value
  <chr> <int> <chr>
                                <db1>
           <u>2</u>013 exports
1 AT
                               53.4
           2013 unemployment 5.34
2 AT
3 AT
           <u>2</u>014 exports
                               53.4
           2014 unemployment 5.62
4 AT
5 DE
           <u>2</u>013 exports
                               45.4
           2013 unemployment 5.23
6 DE
7 DE
           <u>2</u>014 exports
                               45.6
8 DE
           2014 unemployment 4.98
```

- Better understood as relative descriptions of data
 - It is more straightforward to speak of a data set that is longer relative to another

Exercise 1: filtering and reshaping

- Use the data set exercise_1.csv contained in wrangling_exercises_data.zip
- Import the data and ...
 - ...only consider data on Greece and Germany between 1995 and 2015
 - ...make it longer

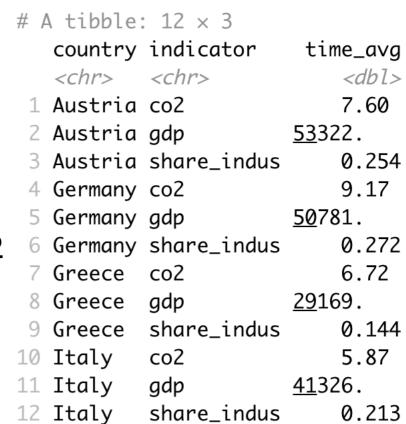

Link to possible solution

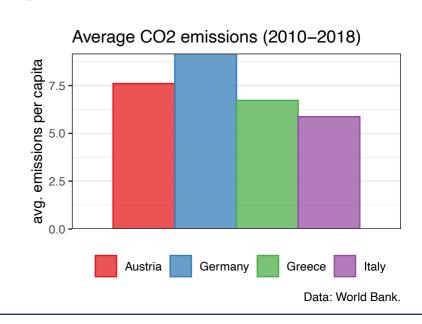

# A tibble:	12 ×	4	
country	year	indicator	value
<chr></chr>	<int></int>	<chr></chr>	<db1></db1>
1 Germany	<u>2</u> 012	gdp	<u>49</u> 872.
2 Germany	<u>2</u> 012	co2	9.45
3 Germany	<u>2</u> 013	gdp	<u>49</u> 954.
4 Germany	<u>2</u> 013	co2	9.64
5 Germany	<u>2</u> 014	gdp	<u>50</u> 846.
6 Germany	<u>2</u> 014	co2	9.11
7 Greece	<u>2</u> 012	gdp	<u>28</u> 323.
8 Greece	<u>2</u> 012	co2	7.25
9 Greece	<u>2</u> 013	gdp	<u>27</u> 811.
10 Greece	<u>2</u> 013	co2	6.61
11 Greece	<u>2</u> 014	gdp	<u>28</u> 130.
12 Greece	<u>2</u> 014	co2	6.39

Exercise 2: mutating, selecting & summarising

- Use the data set exercise_2.csv contained in wrangling_exercises_data.zip
- Import the data
 - Only keep the variables gdp, share_indus, and co2
 - Divide the industry share in GDP with 100
 - Only keep data between 2010 and 2018
 - Compute the averages over time for all countries
- Bonus:
 - Visualise the resulting CO2 average via a bar plot

Summary & outlook

Summary

- After importing raw data you usually must prepare them → make tidy
- Tidy data is the input to any visualisation/modelling task and defined as data where:
 - Every column corresponds to one and only one variable
 - Every row corresponds to one and only one observation
 - Every cell corresponds to one and only one value
- It is usually a good idea to write a script that imports raw, and saves tidy data
- Such script usually makes use of functions from the following packages:
 - data.table, dplyr, tidyr, and here

Summary

- These packages provide functions that help you to address some wrangling challenges that regularly await you:
 - Reshaping data: tidyr::pivot_longer() and tidyr::pivot_wider()
 - Filtering rows: dplyr::filter()
 - Selecting columns: dplyr::select() and the select helpers
 - Mutating or creating variables: dplyr::mutate()
 - Grouping and summarising: dplyr::group_by() and dplyr::summarise()
 - Merging data sets: dplyr::*_join()
- In later sessions we will learn also about some convenience shortcuts

Outlook

- We now covered the basics in all fundamental data science activities
 - We can now turn to the 'funny' part: modelling and analysis
- But before we will learn how to write reports using R Markdown
 - → Learn to communicate your R activities to others by combining them with text, and distributing them online

Tasks until next week:

- 1. Fill in the quick feedback survey on Moodle
- 2. Read the lecture notes posted on the course page and replicate them
- 3. Have a look at the mandatory readings (step the challenges we did not cover yet)
- 4. Do the **exercises** provided on the course page and **discuss problems** and difficulties via the Moodle forum
